Selected Game Concept:

A simple Local PVP game, where the players can cast spells to summon minions for them. The players themselves can't attack/defend/heal themselves but they can summon minions with dynamic spell combination to help them in these situations and kill the other player.

The main focus of the game is a simple minion summoning system where the player can combine inputs to create a minion that has a combination of the predefined effects / behaviours.

Gameplay System:

- Minion spawning
- Minion pathfinding
- Player locomotion? (Stationary?)
- Player health

Implementation Plans:

First playable

- player 1 (Keyboard) / player 2 (Controller)
- basic minion movement
 - Direct movement towards the other player.
- Dynamic minion types
 - Predefined stats and behaviours that will be combined with input sequence for the spells.

Possible challenges:

Scope creep (Minion behaviours)

- Because the amount of behaviour types is very open ended, it will be very easy to go overboard and create too many different behaviours

Game balancing

- The behaviour of a group of enemies and creating a skill based gameplay in spawning them at the right position and time.
- Creating a situation for the player to think about the type of minion spell that they create and how to use it to defeat the other player.

Minion movement

- Creating a relatively simple but interesting minion path finding so the movement is still predictable, but not a straight line.

Spell variation

- making it so that the players have a diverse and interesting amount of spell combinations to spawn minions so that the gameplay will be more interesting.
